Amendments to the Claims

Claim 1 (currently amended). A ball grid array mounted circuit comprising:~~;~~

a flexible stress relief substrate having a top surface and a bottom surface;

spaced conductive vias extending between the top surface and said bottom surface;

connection pads at said top surface with each connection pad capturing at least one of said vias;

connection pads at said bottom surface ~~in registration~~ connected by said conductive vias with said connection pads at said top surface;

an electronic component having a first thermal coefficient of expansion (TCE) and having connection pads spaced to align with said connection pads at said top surface;

first solder connections formed from solder balls between said connection pads at said top surface and said component connection pads;

a printed circuit board (PCB) having a second TCE and having connection pads aligned with said connection pads at said bottom surface;

second solder connections formed from solder balls between said connection pads at said bottom surface and said PCB connection pads, wherein said first solder connections and said second solder connections are shaped to absorb at least a portion of the stress due to differences between said first TCE and said second TCE with said second solder connections free of underfill.

Claim 2 (currently amended). Ball grid array mounted circuit of claim 1 wherein said flexible stress relief substrate ~~comprises a flexible polyimide like material having~~ has a thickness in the range of about 2 to 5 mils.

Claim 3 (currently amended). Ball grid array mounted circuit of claim 1 wherein said electronic component connection pads have a size ~~substantially~~ larger than a size of said connection pads at said top surface and said first solder connections have a substantially smaller cross section at said pads at said top surface than at said component connection pads which acts to absorb at least a portion of the stress due to differences between said first TCE and said second TCE.

Claim 4 (currently amended). Ball grid array mounted circuit of claim 1 wherein said PCB connection pads have a size ~~substantially~~ larger than a size of said connection pads at said bottom surface and said second solder connections have a substantially smaller cross section at said pads at said bottom surface than at said PCB connection pads which acts to absorb at least a portion of the stress due to differences between said first TCE and said second TCE.

Claim 5 (original). Ball grid array mounted circuit of claim 2 wherein said connection pads at said top surface capture a plurality of said conductive vias.

Claim 6 (original). Ball grid array mounted circuit of claim 2 wherein said conductive vias have a diameter in the range of 1 to 5 mils and a pitch in the range of 2 to 10 mils.

Claim 7 (original). Ball grid array mounted circuit of claim 2 wherein said connection pads at said top surface and said connection pads at said bottom surface have a diameter in the range of about 20 to 30 mils.

Claim 8 (original). Ball grid array mounted circuit of claim 2 wherein said electronic component is a ceramic package having a TCE of about 7 ppm/degree C and said PCB has a TCE in the range of about 12-25 ppm/degree C.

Claim 9 (original). Ball grid array mounted circuit of claim 2 wherein said electronic component is a chip scale package and said conductive vias have a pitch in the range of about 10 to 40 mils.

Clam 10 (original). Ball grid array mounted circuit of claim 2 wherein said electronic component is a ruggedized die having an array of pads suitable for mounting to a PCB.

Claim 11 (original). Ball grid array mounted circuit of claim 2 wherein said conductive vias are located in said flexible substrate only at said connection pads.

Claim 12 (currently amended). A ball grid array mounted circuit comprising;

a flexible stress relief substrate having a top surface and a bottom surface;

spaced conductive vias extending between the top surface and said bottom surface;

connection pads at said top surface with each connection pad capturing at least one of said vias;

connection pads at said bottom surface ~~in registration~~ connected by said conductive vias with said connection pads at said top surface;

an electronic component having a first thermal coefficient of expansion (TCE) and having connection pads spaced to align with said connection pads at said top surface, said

electronic component connection pads being of a larger size than said connection pads at said top surface;

solder connections formed from solder balls between said connection pads at said top surface and said component connection pads, with said larger size pads causing said solder connections to have a substantially larger cross section at said component connection pads than at said connection pads at said top surface;

a PCB having a second TCE and having connection pads aligned with said connection pads at said bottom surface, said PCB connection pads being of a larger size than said connection pads at said bottom surface; and

solder connections formed from solder balls between said connection pads at said bottom surface and said PCB connection pads with said larger size pads causing said solder connections to have a substantially greater larger cross section at said PCB connection pads than at said connection pads at said bottom surface; and

wherein connections formed between said component connection pads and said PCB connection pads have an hourglass shape, and act to absorb at least a portion of the stress due to differences between said first TCE and said second TCE.

Claim 13 (currently amended). Ball grid array mounted circuit of claim 12 wherein said flexible stress relief substrate ~~comprises a flexible polyimide like material having~~ has a thickness in the range of about 2 to 5 mils.

Claim 14 (original). Ball grid array mounted circuit of claim 12 wherein said connection pads at said top surface capture a plurality of said conductive vias.

Claim 15 (original). Ball grid array mounted circuit of claim 12 wherein said conductive vias have a diameter in the range of 1 to 5 mils and a pitch in the range of 2 to 10 mils.

Claim 16 (original). Ball grid array mounted circuit of claim 12 wherein said connection pads at said top surface and said connection pads at said bottom surface have a diameter in the range of about 20 to 30 mils.

Claim 17 (original). Ball grid array mounted circuit of claim 12 wherein said electronic component is a ceramic package having a TCE of about 7 ppm/degree C and said PCB has a TCE in the range of about 12-25 ppm/degree C.

Claim 18 (original). Ball grid array mounted circuit of claim 12 wherein said conductive vias are uniformly spaced throughout said flexible substrate.

Claim 19 (original). Ball grid array mounted circuit of claim 12 wherein said conductive vias are located in said flexible substrate only at said connection pads at said top surface.

Claims 20-23 (withdrawn).

Claim 24 (currently amended). An interposer for making first connections to an electronic component having a first thermal coefficient of expansion (TCE) and second connections to a printed circuit board (PCB) having a second TCE in a ball grid array mounted circuit comprising:

a flexible stress relief substrate having a top surface and a bottom surface;

spaced conductive vias extending between the top surface and said bottom surface;

connection pads at said top surface with each connection pad capturing at least one of said vias;

said first connections formed from solder balls between said connection pads at said top surface and connection pads located at a surface of said electronic component wherein said first solder connections have a ~~substantially~~ smaller cross sectional area at said connection pads at said top surface than at said connection pads located at said electronic component;

connection pads at said bottom surface connected by said conductive vias ~~in registration~~ with said connection pads at said top surface;

said second connections formed from solder balls between said connection pads at said bottom surface and connection pads located at said PCB wherein said second solder connections have a ~~substantially~~ smaller cross sectional area at said connection pads at said bottom surface than at said connection pads located at said PCB; and

wherein a combination of said first connections and said second connections have hour-glass shapes which are sufficiently compliant to absorb at least a portion of the stress related to a difference in said first TCE and said second TCE.

Claim 25 (currently amended). The interposer of claim 24 wherein said flexible stress relief substrate ~~comprises a flexible polyimide-like material having~~ has a thickness in the range of about 2 to 5 mils.

Claim 26 (original). The interposer of claim 25 wherein said conductive vias have a diameter in the range of 1 to 5 mils and a pitch in the range of 2 to 10 mils.

Claim 27 (original). The interposer of claim 26 wherein said connection pads at said top surface and said connection pads at said bottom surface have a diameter in the range of about 20 to 30 mils.
